Portfolio

Backend-leaning Full Stack developer, equally at home on a Vue 3 / Nuxt 3 frontend, Go services or a Kotlin monolith. Since 2023 on Cadremploi.fr (1.5M monthly visits), I have been working on the full rebuild of the site while keeping the legacy it replaces running in production, from development to deployment on GCP. Constrained environments are my usual ground — GDPR compliance today, medical imaging interoperability before. Outside work, I build my own apps (Android, Flutter, Go) and contribute to open source in Swift.

EDUCATION

MASTER'S LEVEL DIGITAL TECHNOLOGY ARCHITECT

42 / Paris / November 2015 - March 2020

LANGUAGES

French - Native

Portuguese - Native

Spanish - Bilingual

English - Fluent

INTERESTS

Computing, Music, DIY, Board games

EXPERIENCES

FULL STACK DEVELOPER

Figaro Classifieds, Paris

Since May 2023

Building and evolving Cadremploi.fr, a French executive job board, within a product team: high-traffic platform (1.5M monthly visits) under strict regulatory constraints (GDPR).

- **Full rebuild of Cadremploi.fr** in Vue 3 / Nuxt 3, joined in its first week: **#1 contributor by commits** and **#2** by code volume (+21,800 lines excluding generated files, 140 tickets delivered), **original owner of the job detail and authentication components**, author of the sign-up flow, the SEO listing pages and 2 of the 7 Playwright end-to-end test suites.
- **Homepage rebuild** on the new stack: HomePage refactor in the Go API with the CMS client aligned on legacy behavior, **title / description tags and structured data**, and new editorial blocks ("Discover the jobs that are hiring", campaign banner).

SKILLS

TECH SKILLS

Languages

Go, Kotlin, TypeScript, JavaScript, Swift, Dart, Python, C++, C

Frontend & mobile

Vue 3, Nuxt 3, React, Jetpack Compose, Flutter, SwiftUI, Playwright

Data & search

PostgreSQL, Oracle, ElasticSearch, Pub/Sub, Technical SEO

Infra & tooling

GCP, Kubernetes, Helm, Docker, Terraform, Datadog, Git

SOFT SKILLS

Autonomy

Pair programming

Adaptability

- **Technical SEO across all three layers of the platform:** **schema.org structured data** composable (JobPosting, breadcrumbs) and **internal linking** components in Nuxt; SEO packages for listing and detail pages and an **automated taxonomy sitemap** in the Go API; **region, department and city SEO hubs** in the Kotlin monolith. In September 2026, **rolled the new taxonomy out to 100%** (categories and occupations), removing the legacy code (–900 lines), with a **301 redirect plan** and an enriched GA4 data layer.
- **Top contributor by volume to the GDPR compliance API in Go** (44% of the service's lines): **newsletter unsubscription through the CRM**, 4 of the 13 account-deletion connectors (CRM, user registry, ElasticSearch, RTP gateway), personal data export, and **6-year legal retention** with staged warning emails and 3 of the service's 4 Kubernetes CronJobs.
- Designed and wrote an **orphaned-account reconciliation batch** end to end: idempotent three-step fail-fast deletion, semaphore-bounded concurrency, a 50,000-entry memory guard, and an **expensive detection query cut from one call per batch to one call per run**. **917 orphaned accounts purged** on first production run, then monitored daily runs (Datadog, Slack).
- Development within the **hexagonal architecture** of the Go search API, where I am the **top owner of the business domain** (43% of lines): composed **9 search strategies** (exact, geographic, broadened and variants) on top of ElasticSearch with **application-side merging and deduplication**, and designed the **8 threshold-based business badges** module ("active recruiter", "be the first to apply"...) backed by in-memory maps and batch calls.
- **Merged 2 microservices into a single API** for the Figaro Emploi recruiter space (Go / Gin, ~15,000 lines migrated): secured Swagger endpoints, took over DB migrations, **decommissioned the old backends** and switched their routes on the KrakenD gateway; wrote the **Terraform module** (network, Cloud SQL, Kubernetes) for staging and production.
- **Kotlin development on the Cadremploi monolith** (Spring, Spring Batch, Hibernate, Oracle, JSP) alongside the rebuild: 171 Kotlin files across 4 Maven modules, **92 production releases** between 2024 and 2026, **fixed an Oracle session saturation incident** (non-blocking DBMS_LOCK application lock), and brought persistent login **into CNIL compliance**.
- Evolved the **APEC and France Travail partner job feeds** with INSEE reference data enrichment, and built **bulk job applications** end to end (API, Pub/Sub, sender service, confirmation emails); **reduced technical debt** by fully decommissioning the newsletter (73 files, –1,677 lines).

PROJECTS

Family Tracker — personal project

Real-time family location sharing (shared map, trips, meetups, SOS, chat). Android app in Kotlin / Jetpack Compose, web version, Go API (PostgreSQL, JWT, WebSocket/STOMP) rewritten from Spring Boot with an identical protocol.

family-tracker-web-z4ur.onrender.com/
PDFland — personal project

PDF editor for Android (fully offline) and the browser: signing, rewriting text in its original font, scanning, merging, compression. Flutter app and React web app sharing one Go PDF engine (pdfcpu), embedded through dart:ffi or served by an API.

pdfland-web.onrender.com

Farol — open source (Swift)

macOS terminal for coding agents (libghostty). 9 merged PRs, ~8,000 lines: git graph panel (rebase, fetch/push), three-column merge conflict resolution, multiple Claude Code / Codex accounts.

github.com/snowztech/farol

open-vibe-island — open source (Swift)

Upstream fix merged and multi-account Claude support proposed (1,000+ lines, concurrency off the main actor).

github.com/Octane0411/open-vibe-island

Save My Print & Fast Market List

Nuxt web tools: fixing an empty cartridge's color on a document, and a shopping list with product catalog and live total.

dev-hub-two-rouge.vercel.app

- **Started the Terraform project** of the compliance service (75% of its lines) and the new frontend's initial module; deployments on **GCP** (Kubernetes, Helm, Docker), integration tests against a real ElasticSearch with testcontainers.
- Active part in **architecture decisions**, with strong autonomy, regular **pair programming** and **code reviews**.

FULL STACK DEVELOPER

T2 Technology, Torcy

January 2020 – May 2023

Software development for medical imaging (PACS, exam printing, online services) in a small agile team.

- **Co-designed a Kotlin exam transfer service** over the **DICOM** protocol, in a strongly **interoperability**-driven environment: compliance with **DICOM and HL7** standards and testing across equipment from different vendors.
- Maintained and evolved medical printing software in **C++ and C#**, with a constant focus on **performance and memory management for large images**.
- **Co-designed a Go API** for secure online access to medical exams, including authentication and user role management.
- Built the web viewing interfaces in HTML and JavaScript, in a small team where everyone owned their topics end to end.
